Abscissas and Weights for Gaussian Quadrature For N=2 to 100, and N=125, 150, 175, and 200

# U.S. DEPARTMENT OF COMMERCE

NATIONAL BUREAU OF STANDARDS

#### THE NATIONAL BUREAU OF STANDARDS

The National Bureau of Standards¹ provides measurement and technical information services essential to the efficiency and effectiveness of the work of the Nation's scientists and engineers. The Bureau serves also as a focal point in the Federal Government for assuring maximum application of the physical and engineering sciences to the advancement of technology in industry and commerce. To accomplish this mission, the Bureau is organized into three institutes covering broad program areas of research and services:

THE INSTITUTE FOR BASIC STANDARDS . . . provides the central basis within the United States for a complete and consistent system of physical measurements, coordinates that system with the measurement systems of other nations, and furnishes essential services leading to accurate and uniform physical measurements throughout the Nation's scientific community, industry, and commerce. This Institute comprises a series of divisions, each serving a classical subject matter area:

—Applied Mathematics—Electricity—Metrology—Mechanics—Heat—Atomic Physics—Physical Chemistry—Radiation Physics—Laboratory Astrophysics<sup>2</sup>—Radio Standards Laboratory,<sup>2</sup> which includes Radio Standards Physics and Radio Standards Engineering—Office of Standard Refer-

ence Data.

THE INSTITUTE FOR MATERIALS RESEARCH . . . . conducts materials research and provides associated materials services including mainly reference materials and data on the properties of materials. Beyond its direct interest to the Nation's scientists and engineers, this Institute yields services which are essential to the advancement of technology in industry and commerce. This Institute is organized primarily by technical fields:

-Analytical Chemistry-Metallurgy-Reactor Radiations-Polymers-Inorganic Materials-Cry-

ogenics<sup>2</sup>—Materials Evaluation Laboratory—Office of Standard Reference Materials.

THE INSTITUTE FOR APPLIED TECHNOLOGY ... provides technical services to promote the use of available technology and to facilitate technological innovation in industry and government. The principal elements of this Institute are:

—Building Research—Electronic Instrumentation—Textile and Apparel Technology Center—Technical Analysis—Center for Computer Sciences and Technology—Office of Weights and Measures—Office of Engineering Standards Services—Office of Invention and Innovation—Clearinghouse for Federal Scientific and Technical Information.<sup>3</sup>

# ABSCISSAS AND WEIGHTS FOR GAUSSIAN QUADRATURE FOR N = 2 to 100 and N = 125, 150, 175, and 200

by

#### Carl H. Love

The abscissas and weights for Gaussian Quadrature of order N = 2 to 100, and N = 125, 150, 175, and 200 are given. The abscissas are given to twenty-four places and the error is estimated to be no more than 1 unit in the last place. The weights are given to twenty-three places and the error is estimated to be no more than 1 unit in the last place. Key words: Integration, Gaussian, Quadrature.

#### 1. INTRODUCTION

The advent of high speed digital computers has made the use of Gaussian Quadrature formulae of very high order a practical procedure. It can be programmed with a few instructions and the awkward abscissas are easily handled by the computer. It is a familiar technique which usually converges rapidly, and since the whole range of integration can be covered at once instead of making many subdivisions, it will usually be very efficient.

In addition to its use in numerical integration Gaussian Quadrature can be used in the numerical solution of integral equations and also in the evaluation of functions that can be written as integrals. The last four sets of very high order were computed [1] since "exact values of these quantities are also interesting in view of certain unsettled theoretical conjectures that have been made about distributions of the weights and abscissas." It was reported by Davis and Rabinowitz [2] that there was a "brisk demand" for the sets N=64, 80, and 96 even though they had not been published and there existed some doubt about their accuracy.

Higher order Gaussian Quadratures were found to be very efficient in the calculation of the inductance of rectangular conductors such as strip transmission lines at various frequencies [3]. It was found that if the width of the outer conductors were divided into n equal parts and the width of the inner conductors according to a Gaussian distribution, then the rate of convergence of the inductance function (with respect to n the number of subdivisions) was greatly improved. In order to obtain the limiting value of inductance (for an infinite number of subdivisions) a formula of the form  $L\infty = L_n + a n^{-\alpha}$  was used for sufficiently large n. This equation is most easily solved for the unknowns  $L\infty$ , a, and  $\alpha$ , if the inductance function  $L_n$  is calculated for four different n chosen such that  $N_1/N_2 = N_3/N_4$ . Therefore, specific high order Gaussian Quadratures were needed.

The only high order Gaussian Quadratures that were found in the literature were those mentioned in the references. A. H. Stroud is working on tables for N = 2, 64, 96, 168, 256, 384, and 512 but he has not published them at the present time [4].

The Gaussian Quadrature formula is given by

$$\int_{-1}^{1} F(X) dx \approx \sum_{k=1}^{n} H_{k} F(X_{k}), \qquad (1)$$

where the weighing coefficients H<sub>k</sub> are given by

$$H_k = \frac{2}{nP_{n-1}(X_k)P'_n(X_k)};$$
 (2)

 $P_n(X)$  is Legendre's polynomial of degree n,  $P_n'(X)$  is the first derivative of  $P_n(X)$ , and the  $X_{k's}$  are the zeros of  $P_n(X)$  [5].

From the equations

$$(1-X^2) P_n(X) = n X P_n(X) + nP_{n-1}(X) =$$
  
 $(n+1) X P_n(X) - (n+1) P_{n+1}(X),$  (3)

and with  $X_k$  a zero of  $P_n$  (X) in (3), the following relations can be obtained:

$$(1-X_k^2) P_n(X_k) = n P_{n-1}(X_k) = -(n+1) P_{n+1}(X_k);$$
 (4)

Equation (2) can now be expressed as [6]

$$H_{k} = \frac{2}{(1-X_{k}^{2}) [P_{n}(X_{k})]^{2}} = \frac{2(1-X_{k}^{2})}{(n+1)^{2} [P_{n+1}(X_{k})]^{2}};$$
 (5)

Since  $P_n$  (X) is a symmetric function of X for even n and skew symmetric for odd n, only the positive roots between 0 and 1 have to be calculated [5]. The weights  $H_k$  will be the same for positive and negative X's of the same magnitude.

The roots of the Legendre Polynomials and their corresponding weighing factors were computed as follows. Upper and lower bounds were obtained for the kth root of  $P_n(X)$ , namely  $X_n$ , k, from the fact that the roots of  $P_{n-1}(X)$  separate the roots of  $P_n(X)$ :

$$1 < X_{n, \frac{1}{2}} < X_{n-1, 1}$$
 For  $k = 1$ 

$$X_{n-1}, k-1 < X_n, k < X_{n-1}, k$$
 For  $k > 1$ . (6)

When n is odd, X = 0 is also a root of  $P_n(X)$ .

Setting the lower limit equal to <u>a</u> and the upper limit equal to <u>b</u>, the method of false position can be used to obtain an initial approximation c:

$$C = a + \frac{F(a)}{F(a) - F(b)} (b-a) = a + \frac{P_n(a)}{P_n(a) - P_n(b)} (b-a).$$
 (7)

In order to calculate  $P_n(X)$  and  $P_{n+1}(X)$  the following recurrence relation was used:

$$P_{n+1}(X) = \frac{2n+1}{n+1} \times P_n(X) - \frac{n}{n+1} P_{n+1}(X).$$
 (8)

After an approximation has been obtained, the root  $X_n$ , k can be obtained much faster by using the Newton-Raphson technique which converges quadrically  $\{6\}$ :

$$X_{n+1} = X_n - \frac{F(X_n)}{F'(X_n)},$$
 (9)

where  $X_{n+1}$  is the next approximation to the root  $X_n$ . The value of  $F(X_n)$  can be obtained from (4).

The last four sets (n = 125, etc.) required a little different approach. The first root,  $X_n$ , 1, was obtained for all n between 101 and 200. The fact that the roots of  $P_n(X)$  became monotonically increasingly further apart was then used to locate succeeding roots:

$$1 - X_{n_{1}} < X_{n_{1}} - X_{n_{2}} < \dots < X_{n_{k}} - X_{k+1}$$
 (10)

In order to find the  $X_n$ , k root, the quantity  $a = X_n$ ,  $k-1 - X_n$ , k-2 was found. Then  $\underline{b}$  was set equal to  $X_n$ , k-1 - a and  $\underline{a}$  equal to  $\underline{b}$  - a. The polynomials  $P_n$  (a) and  $P_n$  (b) were examined to see if they were of opposite sign, If so, the upper and lower bounds were found and the root was calculated as before. If they had the same sign, then  $\underline{a}$  and  $\underline{b}$  were both decreased by  $\underline{a}$  and the above process repeated until  $P_n$  (a) and  $P_n$  (b) did indeed have opposite signs.

#### 3. ERRORS

The calculations were done with a double precision computer routine. The routine was accurate to  $1.9 \times 10^{25}$  (or  $2^{84}$ ).

In order to check the accuracy of the abscissas the formula  $\sum_{1}^{n} X^{2}_{k} = \frac{n(n-1)}{2n-1}$  was used. The largest error found was 5 units in

the 24th decimal place and the next largest was 2 units in the 24th place. More than half of the checks had zero error in the 24th place. Squaring a number that has an error in the kth place gives an error in the kth place that is approximately twice that of the original error. When checking the tables in references [1], [2], and [5] only one error in the abscissas was found. This was in reference [5] where an error of 0.5 units in the 21st place was discovered. The calculations had been carried out to 7.6 x  $10^{22}$  and the abscissas given to 21 places. The 21st-23rd places are 851 but the value given in the table was 8 in the 21st place instead of being rounded up to 9.

In this report the abscissas have been given to 24 places and it has been concluded that there is an error of no more than 1 unit in the last place. It is also concluded that this occurrence will be very rare. There will be further comments on the abscissas after the weights have been examined.

The weights were checked by summing them between zero and one and comparing the results to unity. The largest error found was 1.48 units in the 23rd place. The previously mentioned references were checked for errors in the weights and no error larger than 1 unit in the last place was found through n = 48, In reference [5] a table of errors obtained by summing the weights in references [1] and [2] is given. Even though the error in reference [1] reaches 11 units in the last place, there is no error in any individual weight of more than 1 unit. It is interesting to note that the errors in [1] are always 1 unit too small and are caused by not rounding up. It was only when the first omitted digit was 9 that the rounding was done correctly and then only half the time.

It was found that the errors in the higher order tables of reference [5] (up to n = 64) were larger than expected. The sums of some weights were in error 4 units in the last place, but almost all the error was concentrated in the first or second weight. For example, the value of the first weight for n = 64 was found to be 4.7 units too small in the last place and the sum of the weights was 4 units too small.

Since the preceding observation questioned the accuracy of the 23rd place of the first two weights of higher n in this report, the following analysis was made. It was assumed that the errors would follow the same behavior pattern in double precision as in single precision. Starting at n = 50, all the higher orders were calculated in single precision and the sum of the weights obtained. Single precision was 6.87 x 10<sup>10</sup> (or 2<sup>36</sup>) which is less than eleven significant digits. It was assumed that there were eleven good digits and the error in the 9th place was examined. For n up to 100 the largest error in the sum was 3.0 units in the 9th place and 2.2 units for an individual weight. The largest error in the last four sets was 3.9 units in the 9th place of the sum but only 2.3 units for any individual term. It was observed that if the error in the sum was 1 unit or more in the 9th place, it was concentrated in the first two weights.

6

These results tend to show that the errors do follow a similar pattern and give an error bound on the weights. It is to be remembered that in single precision there were <u>less</u> than eleven significant digits and the error in the 9th place was examined while in double precision there were <u>more</u> than twenty-five significant digits and the error in the 23rd place was examined. Hence, the error in the 9th place in single precision should be greater than the error in the 23rd place in double precision. It was concluded, on the basis of the preceding discussion and the fact that the largest error in the sum in double precision was 1.48 units in the 23rd place, that the individual weights were accurate to within 1 unit in the 23rd place.

The sum of the squares of the abscissas were checked and the largest error was 4 units in the 10th place. This was a better check than the double precision because of a "digit" problem. The sum of the checks reaches a value of approximately fifty for higher n and hence it is impossible to obtain the sum accurately to more than twenty-three decimal places. When the single precision was used, the squaring and summing were done in double precision and hence the error in the 10th decimal place could be examined. It has been mentioned previously that squaring tends to double the error and also that there are less than eleven good digits in single precision while in double precision there are more than twenty-five good digits. Hence, the error is no more than 1 unit in the 24th place.

The three values of n given in reference [2] were checked and were accurate to within 1 unit in the last place. This is better than one would expect from the above analysis since that author was only calculating his abscissas to an accuracy of 5.1 x 10<sup>-22</sup>, which is approximately 1 digit less than reference [1]. It is believed the better accuracy was obtained because of the rapid rate of convergence of the Newton-Raphson method and because triple precision was used. The convergence

rate was in fact observed to be approximately "squared;" the errors were approximately  $10^{-4}$ ,  $10^{-8}$ ,  $10^{-16}$  for successive iterations. Hence, when the error condition was satisfied, the roots were probably more accurate than expected and therefore the weights were more accurate. It is believed that the larger error of the first two weights is caused by the  $1-X^2$  term in the numerator of the expression for the weights.

#### 4. TABLE ERRORS

After the final form of the manuscript had been prepared, the abscissas and weights were punched onto cards from the manuscript. These values were then subjected to the same numerical checks as before and the errors checked to insure they were the same as before. The values were also compared against the values that were punched onto cards during the computation.
